

Indicator: Infant Mortality

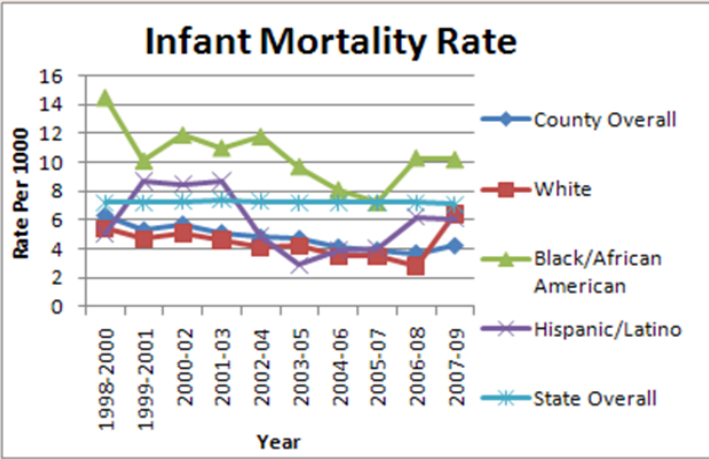

Description: Number of infants who die within one year of birth per 1,000 live births.

Sources: FloridaCHARTS—<http://www.floridacharts.com/charts/report.aspx?domain=03&indnumber=0053>

Caveats: Infant mortality is calculated relative to the number of live births so that changes in the value of the indicator reflect the likelihood of an infant dying and not just the level of births in a year. The volatility of the rate for the county is likely due to a relatively few number of births. Data is presented as a 3 year rolling average—the average value over three rolling 3-year time periods.
